**Univariate and Bivariate Analysis**

**Univariate Analysis:**

- Examined individual features for distribution:
    - tenure → skewed toward short-tenure customers
    - MonthlyCharges → slightly right-skewed
    - Churn → ~26% customers churned

**Bivariate Analysis:**

- Studied relationship with target Churn:
    - tenure vs Churn → low-tenure customers churn more
    - MonthlyCharges vs Churn → higher charges → higher churn
    - service_count vs Churn → more services → less churn

**Visualizations:**

- Boxplots, histograms, barplots for distributions
- Correlation heatmap to check multicollinearity
